

DLA NV012 Teaming Brief

AI for Federal Vendor Economic Dependency — DLA SBIR Teaming Brief (Technical Provider)

The opportunity: DLA SBIR topic **DLA26BZ03-NV012** — *AI-Powered Tool for Automated Evaluation of Vendor Economic Dependency*. Phase I **\$100K / 12 mo** → Phase II **\$1M / 24 mo** → Phase III transitions DoD-wide. **Closes 22 July 2026**. Customer (DLA) is already attached. **Us:** GovCon Edu, product **Mindy** — the **technical provider** (the AI/data engine). **We're looking for a prime** with **CMMC Level 2 + agency-side SFFAS 47 / audit-readiness** expertise — the two pieces this topic hinges on. You prime; we bring the tech.

What DLA wants

An AI tool that automatically assesses how economically dependent each DLA vendor is on the government — identifying **related parties and concentration risk per SFFAS 47** to support audit readiness and supply-chain resilience. Today this is manual and can't scale across thousands of vendors and millions of transactions.

The tool must: resolve a vendor universe from DLA's EBS transaction data → retrieve public financials (SEC EDGAR, 10-Ks, SAM.gov) plus alternatives for private vendors → compute economic dependency (vendor's **DLA Working Capital Fund revenue** ÷ its total consolidated revenue) against a **configurable** threshold → flag related-party/risk indicators by contract type → produce **auditable, independently re-computable** results a human analyst reviews (DLA makes the final call).

What WE bring (built and proven)

- **The data engine + entity-resolution spine.** Our platform (Mindy) already resolves vendors across **CAGE / UEI / DUNS** and computes **federal spend per vendor at scale** across the entire USASpending universe (317K contractors) — the hard data-engineering (entity resolution, aggregation by parent vendor, multi-source joins) is a production capability, not a research risk. (*e.g., it returns McKesson's \$84B / Pfizer's \$28B in federal spend instantly.*) This same machinery computes the tool's DLA-specific numerator from DLA's transaction data.
- **The public-financial join (the denominator).** Built to ingest SEC EDGAR 10-K revenue + SAM.gov — the exact sources the topic names — with a fallback path for private/foreign vendors (audited-statement harvesting, OCR, commercial DBs).
- **Provenance + explainability by default.** Every figure carries its source + as-of date, and our calcs are deterministic and re-derivable — the "auditable, traceable, independently re-computable" evidence the topic and SFFAS 47 require.

The dependency metric (per DLA's own Q&A): economic dependency = a vendor's **DLA Working Capital Fund revenue/disbursements** ÷ its **total consolidated revenue**. The DLA-specific numerator is computed from DLA's transaction data (provided post-award); vendor-wide federal spend is the *secondary* supply-chain layer. We bring the engine that does both.

What we need in a PRIME (this is the ask)

This topic hinges on two things Mindy deliberately doesn't cover — so we want a prime who brings both:

- **CMMC Level 2** (self-attestation + active SPRS score) — a **condition of award** for this topic, and the CUI-compliant environment Phase I is performed in.
- **Agency-side SFFAS 47 / audit-readiness expertise** (FIAR, FASAB — helping DLA audit its *own* books, not contractor-side DCAA/FAR) — to define the dependency/related-party criterion, anchor the proposal in DLA's audit language, and own the compliance methodology.

We were originally set to prime this ourselves, but a prime with **both** of those puts the team in a far stronger position — so we'd rather come in as the technical provider (the "✅ What WE bring" engine above is our lane).

The deal (for the prime)

- **You prime; we're the essential tech sub.** You hold the award, the customer relationship, and Phase III; we deliver the engine that makes the tool work. Clean two-party structure.
 - **Real upside.** \$100K Phase I → \$1M Phase II → Phase III sole-source pathway, DoD-wide.
 - **Light integration lift.** The AI/data pipeline is ours and largely built — you bring the CMMC posture and the SFFAS-47 standard, not a from-scratch engineering effort.
 - **Fast.** Closes 22 July 2026 — we're moving now.
-

Phase I in one breath

A feasibility study: take DLA's de-identified sample EBS data → resolve the vendor universe → compute the DLA WCF-dependency numerator → pull public + private financials for the denominator → apply the configurable SFFAS-47 criterion → deliver a **proof-of-concept tool + a "golden dataset" methodology + exportable audit evidence + a Phase II plan**. Not production, and not final determinations — proving the concept is feasible on real data.
